# Full height rotor turnstiles

for checkpoints with increased security requirements

Complete overlap of  
the passage zone

Lock-chamber  
mode

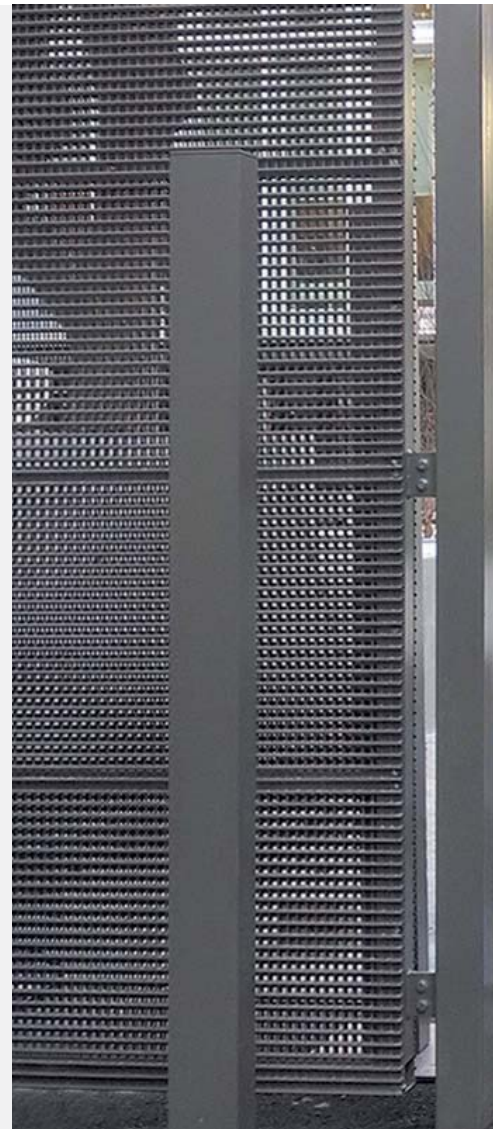

All-weather  
design

PERCo full height rotor turnstiles reliably block the passage zone, which allows them to be applied at facilities with enhanced security requirements.

Thanks to their corrosion resistance, full height turnstiles and security gates can operate both indoors and outdoors. A canopy ensures protection against direct precipitation and any attempts to climb over the top of the turnstile. A foundation frame simplifies the process of installation and improves its quality.

Supplementing the turnstiles with full height security gates enables users to pass through carrying bulky goods. The passage zone can be formed with the use of railings, made in the same design as the turnstiles and security gates. Double passage full height turnstiles make it possible to organize two controlled passageways within a limited space.
